Notebook, N-03-06-26

This notebook contains dated entries from June, September, and November 1903. Included are notes and drawings by Edison regarding storage batteries, phonograph recording and reproduction apparatus, and etheric force experiments. Some of the entries pertain to the use of storage batteries in automobiles. There is also a list of fifteen "probable causes" for loss of capacity in the Edison battery. At the beginning of the book is a 15-page list of chemical compounds compiled by an unidentified experimenter. The pages are unnumbered, and several pages have been removed from the book. Approximately 90 pages have been used.

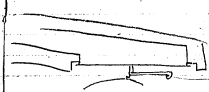
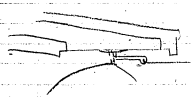
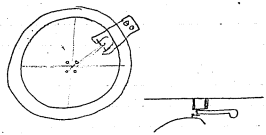
Rubber on both sides of edges - forced in acceptable
so as to put skin under tension.





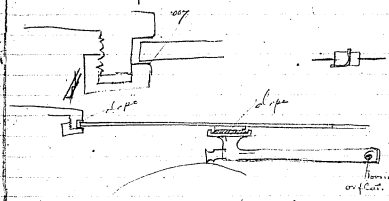
powerful tension

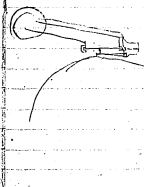
Nov 7 1903



Diaphragm, in four sections ø 0.0005 apart possibly 8 sections better. There would be only one fundamental and no overtones by [redacted] placing of pins coincident. Recorder latest could break this up from a fundamental to overtones of lower compatibility.

Nov 20 1903

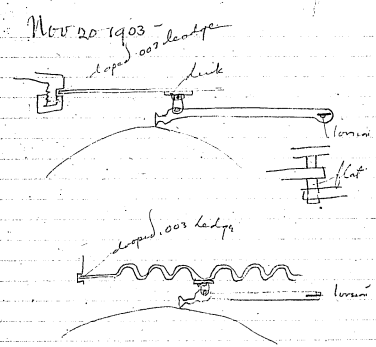




5/8 dia Mica .0015 to .002
Tonnin levers. also dropped wed.
Try shellacked tissue paper dia —
edge on 003 bridge dopped heavy
dope.

Try 1/16 felt dia - doped small bridge —
Tonnin ~~dia~~ lever

Nov 20 1903 –



Try putting X Ray & Radium fluorescers under pressure gradually moving between thick glass plates,

Try Radium on Chalk telephone when working acc of charges Capillarity or rotation,

Nov 20 1903

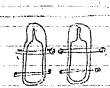
Size of Radium changes hysteresis in Metal rod –

See if rod gives off a ray at the moment when it Cools down from high heat & gives that jerk – also try it in Coil & try Current heating wire as source & detect by fluorescent sulphide & try Oxides – These should be a powerful change also try wire with X Y Z receivers –

Make a slide with all the Metals & Metal Oxides &c

ditto with all the Oxides
" " Hydroxides

Make a slide with 50 vials for liquids in lime glass



Nov 20 1903.

Some of probable causes of Nickel Electrode in SB. losing its capacity for full discharge by several hundred reversals -

1st Sulphur forming Sulfide or blinding grid
2nd Gelatinous Silica
3 " " Aluminum -
4 Iron deposited inside and acts as reducing agent, Calyhzer,
5 Mercury depositing inside -
6 Tin depositing inside,
7 Impurities in Iron depositing inside -
8 Nickel reduced to metal Hydride
9 " " to an oxide dehydrated
10 " " to Metal
11 Hydrogen passing down pores of graphite getting nickel hydrox out contact
12 Iron or impurities depositing on grid or graphite then oxidizing get Ni OH out contact
13 Highly conc KOH forced in a heat burns Ni OH to white insol Ni OH, same as when its heated in KOH,
14 Hg gets in and forms Na Amalg & reduces Ni OH to Metal gritty,

15
16 Hydrogen giving swells grid too much

"

Nov 20 1903

Try Radium on a small cell see how it effects. Em T -

Dissolve all varities of asphaltic in Carbon Disulphide with various proportions of Sulphur that Evaporate CS_2 & Vulcanize to obtain a substance hard hard rubber suitable for operations on S Battery

Possibly some of above will melt & act as hardeners for phono Records

In place of Carnauba Shunk Shellac & some of the metal will do to harden made by fusion process fm Acetate, for Records Etc.
